Operation of the Kardex Shuttle

This unit could accept any product to a maximum height of 760mm with rail centres at 125mm. The machine has standard software where the tray number is entered onto a keypad and the unit will retrieve the required tray. AMH can provide software upgrades should you require.

Installation and Training

Our quotation is based on the availability of a clear and level site. A suitable forklift truck and driver for offloading and positioning the machine will be required. A 415v, 3-phase electrical supply, rated at 16amps will be required to connect to the machines isolator. Fully trained experienced AMH engineers will install the machine and on completion will provide full on-site training before handing over.

Warranty

All the machines mechanical and electrical components are warranted against defective workmanship and materials for one year after date of installation. This does not include where failure has occurred through misuse, negligence, abuse, accident, fire, water or any other cause beyond the control of AMH Services Ltd
